Configure node-scoped NDMP

Enable node-scoped NDMP on the cluster

You can back up volumes hosted on a single node by enabling node-scoped NDMP, enabling the NDMP service, and configuring a LIF for data and control connection. This can be done for all nodes of the cluster.

Node-scoped NDMP is deprecated in ONTAP 9.

About this task

When using NDMP in node-scope mode, authentication must be configured on a per-node basis. For more information, see [the Knowledge Base article "How to configure NDMP authentication in the 'node-scope' mode"](#).

Steps

1. Enable node-scoped NDMP mode:

```
cluster1::> system services ndmp node-scope-mode on
```

NDMP node-scope-mode is enabled.

2. Enable NDMP service on all nodes in the cluster:

Using the wildcard "*" enables NDMP service on all nodes at the same time.

You must specify a password for authentication of the NDMP connection by the backup application.

```
cluster1::> system services ndmp on -node *
```

```
Please enter password:
Confirm password:
2 entries were modified.
```

3. Disable the `-clear-text` option for secure communication of the NDMP password:

Using the wildcard "*" disables the `-clear-text` option on all nodes at the same time.

```
cluster1::> system services ndmp modify -node * -clear-text false
```

4. Verify that NDMP service is enabled and the `-clear-text` option is disabled:

```
cluster1::> system services ndmp show
```

Node	Enabled	Clear text	User Id
cluster1-1	true	false	root
cluster1-2	true	false	root

2 entries were displayed.

Configure a LIF

You must identify a LIF that will be used for establishing a data connection and control connection between the node and the backup application. After identifying the LIF, you must verify that firewall and failover policies are set for the LIF.

Beginning with ONTAP 9.10.1, firewall policies are deprecated and wholly replaced with LIF service policies. For more information, see [Configure firewall policies for LIFs](#).

Steps

1. Identify the intercluster LIF hosted on the nodes by using the `network interface show` command with the `-role` parameter.

```
cluster1::> network interface show -role intercluster
```

Current Is	Logical	Status	Network	Current	
Vserver	Interface	Admin/Oper	Address/Mask	Node	Port
Home					
cluster1	IC1	up/up	192.0.2.65/24	cluster1-1	e0a
true					
cluster1	IC2	up/up	192.0.2.68/24	cluster1-2	e0b
true					

2. Ensure that the firewall policy is enabled for NDMP on the intercluster LIFs:
 - a. Verify that the firewall policy is enabled for NDMP by using the `system services firewall policy show` command.

The following command displays the firewall policy for the intercluster LIF:

```
cluster1::> system services firewall policy show -policy intercluster
```

Vserver	Policy	Service	Allowed
cluster1	intercluster	dns	-
		http	-
		https	-
		ndmp	0.0.0.0/0, ::/0
		ndmps	-
		ntp	-
		rsh	-
		ssh	-
		telnet	-

9 entries were displayed.

- b. If the firewall policy is not enabled, enable the firewall policy by using the `system services firewall policy modify` command with the `-service` parameter.

The following command enables firewall policy for the intercluster LIF:

```
cluster1::> system services firewall policy modify -vserver cluster1
-policy intercluster -service ndmp 0.0.0.0/0
```

3. Ensure that the failover policy is set appropriately for the intercluster LIFs:

- a. Verify that the failover policy for the intercluster LIFs is set to `local-only` by using the `network interface show -failover` command.

```
cluster1::> network interface show -failover
```

Vserver	Logical Interface	Home Node:Port	Failover Policy	Failover Group
cluster1	**IC1	cluster1-1:e0a	local-only	
Default**				
			Failover Targets:	
			
	**IC2	cluster1-2:e0b	local-only	
Default**				
			Failover Targets:	
			
cluster1-1	cluster1-1_mgmt1	cluster1-1:e0m	local-only	Default
			Failover Targets:	
			

- b. If the failover policy is not set appropriately, modify the failover policy by using the `network interface modify` command with the `-failover-policy` parameter.

```
cluster1::> network interface modify -vserver cluster1 -lif IC1  
-failover-policy local-only
```
